- 2. (20 points) Prescott Pharmaceuticals has developed a new test for the disease Horrible type A. Only $\frac{1}{1000}$ people is infected with Horrible type A, and the test is correctly positive on sick people 98% of the time. Unfortunately 2% of the time, it returns positive on a well person. Let S denote the event a person is sick, and P denote the event a test is positive.
 - **a.** (10 pts) Determine $\mathbb{P}(S|P)$.

Bayes.

$$P(SIP) = \frac{P(P|S)P(S)}{P(P|S)P(S) + P(P|S)P(S)}$$

$$= .98 \left(\frac{1}{1000}\right)$$

$$= .98 \left(\frac{1}{1000}\right) + .12 \left(\frac{999}{1000}\right) = 0.0467$$

b. (10 pts) Suppose instead, the false positive rate was p instead of 2% (with all other parameters equal). How small must p be so that $\mathbb{P}(S|P) = .99$?

$$\frac{W}{\rho rob} p^{2} = \frac{.98 \left(\frac{1}{1000}\right)}{.98 \left(\frac{1}{1000}\right) + \rho \left(\frac{999}{1000}\right)}$$
Solve for p^{2}

$$\rho \left(\frac{999}{1000}\right) = \frac{.98}{.99} \left(\frac{1}{1000}\right) - .98 \left(\frac{1}{1000}\right)$$

$$\rho = \sqrt{\frac{1}{1000}} \frac{1}{.99} \left(\frac{.98}{.99}\right) \left(\frac{1}{.99} - 1\right) \approx 9.9 \times 10^{-6}$$
