# Some ovoids in the $O_6^+(p)$ quadric (Klein quadric)

Consider a prime  $p \equiv 1 \pmod{4}$ . Let  $\mathcal{S}$  be the set of all  $x = (x_1, \dots, x_6) \in \mathbb{Z}^6$  such that

- 1  $x_i \equiv 1 \pmod{4}$ ; and
- 2  $\sum_i x_i^2 = 6p$ .

Then  $|\mathcal{S}| = p^2 + 1$ ; and for all  $x \neq y$  in  $\mathcal{S}$ ,  $x \cdot y \not\equiv 0 \pmod{p}$ .

Example ( $p = 5$ ,  $|\mathcal{S}| = 5^2 + 1 = 26$ )

$\mathcal{S}$  contains 6 vectors of shape  $(5, 1, 1, 1, 1, 1)$ ;  
20 vectors of shape  $(-3, -3, -3, 1, 1, 1)$ .

Example ( $p = 13$ ,  $|\mathcal{S}| = 13^2 + 1 = 170$ )

$\mathcal{S}$  contains 20 vectors of shape  $(5, 5, 5, 1, 1, 1)$ ;  
30 vectors of shape  $(-7, -5, 1, 1, 1, 1)$ ;  
60 vectors of shape  $(5, 5, -3, -3, -3, 1)$ ;  
60 vectors of shape  $(-7, -3, -3, -3, 1, 1)$ .

# Ovoids in $O_{2n}^+(q)$ quadrics

Let  $V$  be a  $2n$ -dimensional vector space over  $\mathbb{F}_q$  with nondegenerate quadratic form  $Q : V \rightarrow \mathbb{F}_q$ .

(Projective) *points* are 1-dimensional subspaces  $\langle v \rangle < V$ ; such a point is *singular* if  $Q(v) = 0$ . The associated *quadric* is the set of all singular points. A subspace  $U \leq V$  is *totally singular* if it lies entirely in the quadric, i.e. each of its points is singular. A *generator* is a maximal totally singular subspace. All generators have dimension  $n$ , if  $Q$  is chosen appropriately.

An *ovoid* is a set  $\mathcal{O}$  of points of the quadric, meeting each generator exactly once. Equivalently,  $\mathcal{O}$  is a set of  $q^{n-1} + 1$  singular points, no two perpendicular.

The  $O_4^+(q)$  quadric is a  $(q+1) \times (q+1)$  grid; ovoids are transversals of the grid. Ovoids in the  $O_6^+(q)$  quadric exist for all  $q$ . The lattice construction of ovoids in  $O_6^+(p)$  (above) can be generalized to all primes  $p$ .

# Ovoids in $O_{2n}^+(q)$ quadrics

Let  $V$  be a  $2n$ -dimensional vector space over  $\mathbb{F}_q$  with nondegenerate quadratic form  $Q : V \rightarrow \mathbb{F}_q$ .

(Projective) *points* are 1-dimensional subspaces  $\langle v \rangle < V$ ; such a point is *singular* if  $Q(v) = 0$ . The associated *quadric* is the set of all singular points. A subspace  $U \leq V$  is *totally singular* if it lies entirely in the quadric, i.e. each of its points is singular. A *generator* is a maximal totally singular subspace. # The 'binary' ovoids

## Theorem (Conway, Kleidman & Wilson, 1988)

Let  $p$  be an odd prime. Fix a unit  $u \in O^\times$ . Let  $S$  be the set of vectors  $x \in \mathbb{Z}u + 2O \subset O$  such that  $|x|^2 = p$ . Then  $|S| = 2(p^3 + 1)$  and  $S$  consists of  $p^3 + 1$  pairs  $\pm x$ . Reducing these vectors mod  $pO$  gives

$$O = O_{2,p,u} = \{ \langle \bar{x} \rangle : \pm x \in S \},$$

an ovoid in  $O/pO \simeq O_8^+(p)$ .

The proof uses the most basic facts about the  $E_8$  root lattice. Conway et al. also gave a construction of 'ternary' ovoids (replacing the prime 2 by 3 above).

# The 'binary' ovoids

## Theorem (Conway, Kleidman & Wilson, 1988)

*Let  $p$  be an odd prime. Fix a unit  $u \in O^\times$ . Let  $S$  be the set of vectors  $x \in \mathbb{Z}u + 2O \subset O$  such that  $|x|^2 = p$ . Then  $|S| = 2(p^3 + 1)$  and  $S$  consists of  $p^3 + 1$  pairs  $\pm x$ . Reducing these vectors mod  $pO$  gives*

$$O = O_{2,p,u} = \{ \langle \bar{x} \rangle : \pm x \in S \},$$

*an ovoid in  $O/pO \simeq O_8^+(p)$ .*

The proof uses the most basic facts about the  $E_8$  root lattice. Conway et al. also gave a construction of 'ternary' ovoids (replacing the prime 2 by 3 above).

# The 'binary' ovoids

## Theorem (Conway, Kleidman & Wilson, 1988)

# The $r$ -ary ovoids in $O_8^+(p)$

Theorem (M., 1993)

Let  $r \neq p$  be odd primes. Fix  $u \in O$  such that  $\binom{-p|u|^2}{r} = +1$ .

Let  $S$  be the set of vectors  $x \in \mathbb{Z}u + rO \subset O$  such that  $|x|^2 = k(r-k)p$  for some  $k \in \{1, 2, \dots, \frac{r-1}{2}\}$ . Then  $|S| = 2(p^3+1)$  and  $S$  consists of  $p^3+1$  pairs  $\pm x$ . Reducing these vectors mod  $pO$  gives

$$\mathcal{O} = \mathcal{O}_{r,p,u} = \{ \langle \bar{x} \rangle : \pm x \in S \},$$

an ovoid in  $O/pO \simeq O_8^+(p)$ . (Some degenerate cases occur for  $r > p$ .)

The proof uses facts about  $E_8$  and the fact that  $E_8 \oplus E_8$  has  $480\sigma_7(n)$  elements of norm  $n \geq 1$ . (Or  $O$  and theorems on factorization in  $O$ ). Ovoids isomorphic to  $\mathcal{O}_{r,p,u}$  (for primes  $r \neq p$ , including  $r = 2$ ) are the  $r$ -ary ovoids of octonionic type in  $O_8^+(p)$ .

# The $r$ -ary ovoids in $O_8^+(p)$

Theorem (M., 1993)

Let  $r \neq p$  be odd primes. Fix  $u \in O$  such that  $\binom{-p|u|^2}{r} = +1$ .

# Conjectured number of octonionic ovoids

Let  $\mathcal{O}_1, \mathcal{O}_2, \dots, \mathcal{O}_w$  be representatives for the isomorphism types of octonionic ovoids in  $O_8^+(p)$ , under  $G = PGO_8^+(p)$ . The number of ovoids isomorphic to  $\mathcal{O}_i$  is  $[G : G_{\mathcal{O}_i}]$ ; note that

$$|G| = |PGO_8^+(p)| = \frac{2}{d} p^{12} (p^6 - 1)(p^4 - 1)^2 (p^2 - 1)$$

where  $d = \gcd(p - 1, 2)$ .

The subgroup  $W(E_8)/\{\pm I\} \cong PGO_8^+(2) \leq G$  has order

$$|PGO_8^+(2)| = 348,364,800.$$

# Conjectured number of octonionic ovoids

Let  $\mathcal{O}_1, \mathcal{O}_2, \dots, \mathcal{O}_w$  be representatives for the isomorphism types of octonionic ovoids in  $O_8^+(p)$ , under  $G = PGO_8^+(p)$ . The number of ovoids isomorphic to  $\mathcal{O}_i$  is  $[G : G_{\mathcal{O}_i}]$ ; note that

$$|G| = |PGO_8^+(p)| = \frac{2}{d} p^{12} (p^6 - 1)(p^4 - 1)^2 (p^2 - 1)$$

where  $d = \gcd(p - 1, 2)$ .

The subgroup  $W(E_8)/\{\pm I\} \cong PGO_8^+(2) \leq G$  has order

$$|PGO_8^+(2)| = 348,364,800.$$

# Conjectured number of octonionic ovoids

## Conjectured Mass Formula

For  $p \geq 5$ ,

$$\sum_{i=1}^{w(p)} [G : G_{O_i}] = \frac{|G|(p^4 + 239)}{4|PGO_8^+(2)|};$$

i.e.

$$\frac{|PGO_8^+(2)|}{|G_{O_1}|} + \frac{|PGO_8^+(2)|}{|G_{O_2}|} + \dots + \frac{|PGO_8^+(2)|}{|G_{O_w}|} = \frac{p^4 + 239}{4}.$$

The stabilizers  $G_{O_i}$  are not necessarily subgroups of  $PGO_8^+(2)$ . I am not claiming that the terms in this sum are always integers (but in every known case they are).

The cases  $p = 2, 3$  are genuine exceptions. (When  $p = 3$  the octonionic ovoids lie in hyperplanes.)

# Conjectured number of octonionic ovoids

## Conjectured Mass Formula

For  $p \geq 5$ ,

$$\sum_{i=1}^{w(p)} [G : G_{O_i}] = \frac{|G|(p^4 + 239)}{4|PGO_8^+(2)|};$$

i.e.

$$\frac{|PGO_8^+(2)|}{|G_{O_1}|} + \frac{|PGO_8^+(2)|}{|G_{O_2}|} + \dots + \frac{|PGO_8^+(2)|}{|G_{O_w}|} = \frac{p^4 + 239}{4}.$$

The stabilizers  $G_{O_i}$  are not necessarily subgroups of  $PGO_8^+(2)$ . I am not claiming that the terms in this sum are always integers (but in every known case they are).

The stabilizers  $G_{O_i}$  are not necessarily subgroups of  $PGO_8^+(2)$ . I am not claiming that the terms in this sum are always integers (but in every known case they are).

The cases  $p = 2, 3$  are genuine exceptions. (When  $p = 3$  the octonionic ovoids lie in hyperplanes.)

# The abundance of ovoids

## Corollary

*Let  $n(p)$  be the number of isomorphism types of ovoids in  $O_8^+(p)$ . If the Mass Formula holds, then for some absolute constant  $C > 0$ ,  $n(p) \geq Cp^4 \rightarrow \infty$  as  $p \rightarrow \infty$ .*

Currently it is known that  $n(p) \geq 1$  (Conway et al., 1988).

# Verifying the Mass Formula for small $p$

$p$	$w(p)$	Mass Formula
5	2	$96+120 = 216 = \frac{5^4+239}{4}$
7	2	$120+540 = 660 = \frac{7^4+239}{4}$
11	4	$120+120+960+2520 = 3720 = \frac{11^4+239}{4}$
13	4	$120+1080+1680+4320 = 7200 = \frac{13^4+239}{4}$
17	7	$120+120+540+960+3360+4320+11520 = 20940 = \frac{17^4+239}{4}$
19	6	$120+120+1080+7560+8640+15120 = 32640 = \frac{19^4+239}{4}$
23	10	$120+120+120+540+960+2520+3360$ $+7560+20160+34560 = 70020 = \frac{23^4+239}{4}$

Strictly speaking, these terms are *lower bounds* found by enumerating  $r$ -ary ovoids in  $O_8^+(p)$  for small  $r$  and testing for isomorphism. To compute  $\text{Aut}(\mathcal{O})$ , use `nauty` to determine  $\text{Aut}(\Delta(\mathcal{O}))$  where  $\Delta(\mathcal{O})$  is the associated two-graph. In general  $\text{Aut}(\mathcal{O}) \subseteq \text{Aut}(\Delta(\mathcal{O}))$ , and we check that equality holds in all cases.

In general  $\text{Aut}(\mathcal{O}) \subseteq \text{Aut}(\Delta(\mathcal{O}))$ , and we check that equality holds in all cases.

# Canonical bijections between octonionic ovoids in $O_8^+(p)$

Fix odd primes  $r \neq p$  and  $u \in O$  such that  $\binom{-p|u|^2}{r} = +1$ .

Denote the binary ovoid

$$\mathcal{O}_{2,p,1} = \{ \langle \bar{x} \rangle : \pm x \in \mathbb{Z} + 2O, |x|^2 = p \}.$$

An alternative construction of the  $r$ -ary ovoid  $\mathcal{O}_{r,p,u}$  is via the canonical bijection

$$f : \mathcal{O}_{r,p,u} \rightarrow \mathcal{O}_{2,p,1}$$

constructed as follows. Given  $w \in \mathbb{Z}u + rO$  with  $|x|^2 = k(r-k)p$ ,  $1 \leq k \leq \frac{r-1}{2}$ , we have

$$w = xy$$

for some  $x, y \in O$  such that  $|x|^2 = p$  and  $|y|^2 = k(r-k)$ . If we also require  $x \in \mathbb{Z} + 2O$ , then this factorization is unique up to a  $\pm 1$  factor and our bijection is

$$f : \langle \bar{w} \rangle \mapsto \langle \bar{x} \rangle.$$

# Canonical bijections between octonionic ovoids in $O_8^+(p)$
